

Ashly neWR-5 Wall Remote/Network Programmable Multi-Function

Control your system from any location with our Network Enabled remote controls. This device fits in standard wall boxes and uses a wired Ethernet network connection for hook-up. The neWR-5 is a programmable remote button controller for Ashly Network Enabled amps and processors. One neWR-5 targets only one NE amp or processor, but within that unit can adjust preset recall/scroll, channel mute, zone source selection, individual channel level, matrix point level, and logic output if available. All button programming is done across the network using Ashly Protea NE Software.

Features
